## **Build Heap**

1.	Let index = length/2-1. This is the parent of the last node in the tree, i.e. list[index + 1] list[length-1] are leaves
2.	Convert the subtree with root of list[index] into a heap.
a.	Given list[a] is root of tree_list[b] is left child (root
b.	*2 +1), list[c] is right child (root*2+2), if exists Compare list[b] with list[c] to determine larger child, list[largerIndex]
C.	Compare list[a] with list[largerIndex]. If list[a] < li>list[largerIndex], then swap, else already a heap
d.	If swap, repeat step 2 for the subtree of list[largerIndex]
3.	Convert the subtree with the root of list[index-1] into a heap, repeat until list[0]

## Heap Sort

Swap the root with the end of the list. 1.

- 2. Heapify the list up to but not including the root
- 3. Repeat until there is only one node in the list

Simulate the heapsort algorithm manually to sort the argay. all steps 1. Make into a heap 2. Sort [0] 22 22 [1] 31 [2] 9 76 [3] 63 [4] 81 [5] 48 [6] 92 [7]
